

## Capacity Calibration announces Agile Performance Testing (APT)

### Free performance testing designed specifically for Agile development environments

**ARLINGTON, TX - Apr. 10, 2009** – Capacity Calibration, LLC, provider of performance testing solutions for web based applications, today announced the availability of CapCal Agile Performance Testing (APT). CapCal APT is a free performance testing solution designed for application developers and architects specifically for use in Agile development environments. APT seamlessly integrates with build management, continuous integration, and other popular Agile development tools and APT's fast, codeless approach accommodates even the shortest development iterations

“Agile development methodologies allow organizations to rapidly deliver high-quality software that meets and exceeds customer’s expectations”, stated Randy Hayes, CTO at Capacity Calibration. “APT fully supports these principles by providing developers with early and frequent insight into the performance of the applications they build and maintain.”

CapCal APT, as with CapCal’s other revolutionary performance testing solutions, uses a new approach for validating web-based applications under increased user and transaction loads that is based on the same distributed, service-oriented model as the applications it tests. This architecture allows organizations to test application performance in real time from the “cloud” and not just the lab.

APT yields a wealth of information about how application performs under load. By monitoring performance trends from one test to the next users can quickly spot problems and track your progress over time. “Agile methodologies are characterized by short iteration cycles in which requirements are raised, changed, and reprioritized”, says Mr. Hayes. “At the same time, you need to have fully tested code at the end of each sprint. Traditionally performance testing products are too heavy and time consuming to be effective in an Agile environment. You can’t spend 6 weeks writing test scripts if the whole sprint is only 3 weeks long.”

For a live demonstration of CapCal APT or CapCal’s other solutions, please contact us at (972) 479-1182 or visit <http://www.capcal.com/>.

#### **About Capacity Calibration:**

Capacity Calibration, offers an accelerated, simplified, and affordable approach to web load and performance testing. CapCal’s scriptless approach eliminates the time consuming and maintenance intensive activities traditionally associated with developing and maintaining performance tests.

CapCal’s Integrated Test Automation allows functional tests from industry leading vendors to be converted into CapCal performance tests, allowing performance testing to be moved to the earliest possible point in the testing lifecycle.

CapCal' new approach to testing is based on the same distributed, service-oriented model as the applications it is designed to test and monitor. This allows organizations to test application performances in real time from the cloud and not just the lab. It also allows performance tests to be created and managed as a service. No software to install or maintain. No hardware to provision or manage. Testing as a service ensures that your users always have access to the latest CapCal features and capabilities.

Founded in 2008, Capacity Calibration, LLC. is based in Arlington, Texas where it develops and markets test automation solutions designed for medium to large organizations. The company's main product, CapCal, provides Web performance testing designed for use by developers, Quality Assurance (QA) testers, and Information Technology (IT) Managers. CapCal integrates with functional testing tools to eliminate the time and effort typically required to create and maintain performance test scripts.
